Design Operations

Client: Partners in Health

Project: Hôpital Universitaire de Mirebalais

System: OpenMRS

Year: 2012 / 2013

/ Haiti facts 2012

The poorest country in the Americas.

40% of the population at the time had access to basic health care.

In 2010, the earthquake destroyed 80% of the healthcare structure

Prior to the 2010 earthquake, nearly half of all Haitian deaths were attributed to HIV/AIDS, respiratory infections, meningitis and diarrheal diseases.

Half of the children at the time were unvaccinated.

High risk for major infectious diseases, like bacterial and protozoal diarrhea, hepatitis A and E, and typhoid and dengue fever, malaria, leptospirosis and cholera

The enrollment rate for primary school is 67%, and fewer than 30% reach 6th grade

Literacy levels near 50%, average for Latin America and the Caribbean is at 90%.

Hôpital Universitaire de Mirebalais

Partners in Health

The Mirebalais hospital was built by Partners in Health to become the best and biggest hospital in Haiti, providing healthcare for a population of 3 million people.

Very well equipped, with robust IT and power infrastructure provided by solar panels;
State-of-the-art medical equipment, and very good professionals teaching the future generation of Haitian clinicians.

Hôpital Universitaire de Mirebalais

Partners in Health, OpenMRS, ThoughtWorks and I

ThoughtWorks helped Partners in Health to build the digital experience of the Mirebalais hospital.

The system was built on top of OpenMRS, a collaborative open-source software medical record system for supporting the delivery of health care in developing countries.

After 3 months the project has kicked-off, I was brought in to "fix" the user experience problems the team was encountering.

That's me at the Partners in Health office. Boston, January 2013.

UX kick-off

In order to build context, I've sat down with the client's specialists and asked them to guide me through the process from the perspective of the patients.

Hôpital Universitaire de Mirebalais

Journeys and screen flows

I've ran multiple design exercises with the team and the client, which generated artifacts that helped us create more context and identify where we would need to focus our design efforts.

Check-in Flow

Archivist

Low fidelity mockups

My first mockups were very simple and allowed for communication with the team and the client before committing to spend any money and time onto software development, especially because changing the OpenMRS user interface was not going to be an easy task at the time.

Working prototypes

We did as less upfront design as possible, so as soon as a user experience problem was solved in lo-fi, I would help the frontend developer to create working prototypes.

Evolved version of the UI

Hôpital Universitaire de Mirebalais

Style Guide

Together, we also created a live Design System (back then known as UI Style Guide) to help for faster delivering, faster demoing to the client, faster testing out with nurses in Haiti.

UI style guide example

Hôpital Universitaire de Mirebalais

In-site testing

Once we were satisfied with the working software we've built, we took it to hospital grounds in Haiti to test out in loco with people that would actually use the system.

The hospital was still not functioning and multiple things were under construction, however, we were also able to role play how actions could happen and which circumstances the hospital staff could face, all recorded in videos.

ThoughtWorks PM (right) guiding participant during test, Partners in Health nurse (left) observing the test.

Hôpital Universitaire de Mirebalais

Saving lives

We discovered that multiple participants had never used a computer before, hence we observed that keyboard navigation was easier for them to learn (“Enter key + number”), especially under pressure at a hospital environment.

We also replaced as much text as possible with intuitive icons and large elements (“look for the heart and click it”), especially at pieces of software used at the front desk.

Doctors found it life-saving (quite literally) to be able to access things in a patient dashboard, and alerts and system feedback were really important to them.

Hospital staff using the system after changes

Hôpital Universitaire de Mirebalais

Expanding out

The changes to the design for the Mirebalais hospital were so impactful that we were asked to roll it out to the main source of the OpenMRS system.

Today, OpenMRS and the changes I've designed are used all over the world, allowing for millions of people to get easier access to healthcare.

OpenMRS being using in Sierra Leone

Booking.com Customer: Booking.com accommodation partners
Project: App Store
Year: 2019

App Store

Booking.com

When we think of Booking.com, it's easy to think from the traveller's perspective: you access booking.com, search for a place and a date, and a list of great places to stay shows up.

App Store

Partner side

However, Booking.com is a digital travel agency, and we don't own any hotels, so we rely on partners to provide us with their supply of accommodations.

App Store

Third-party software for partners

As a technology company, we know that we cannot dominate the entire market and give every partner's pain point an exclusive solution.

We recognize that there are many tools out there that can help our partners run and manage their properties more efficiently.

I mean, **many** tools.

App Store

Booking.com and third-parties

With that in mind, Booking wanted to ensure that our partners:

1. Had access to the best tools, recommended by our market specialists;
2. That these tools were well integrated with our Booking.com tools, so that partners can have peace of mind that their technology needs don't become huge problems.

App Store

Research

Upon joining the App Store team, I uncovered some key partner problems with third party software, these were some of it:

- Each product has their own varying trial period days.
- Partners never know when/how they are going to be billed.
- To start a trial for some products, partners had to fill in a form or call the product company, then wait to hear back.
- Most trials didn't offer the full range of features.
- After trial, products would automatically go into billing mode.

App Store

Early stages

Product page at Booking's App Store

Trial days would change depending on the product offering.

The button would change to purchase without information that the trial was over.

On click, different things could appear, depending on how our relationship with this provider was set up (trial right away, or go to their website, or to a contact page)

App Store

Early stages

Only place to knowing
if you are on trial.

Only place to
accessing the
product.

App Store

From discovery to solution

After multiple workshops with the product, development and commercial teams, we decided to take the following approach:

For every product in our Booking.com App Store, we would offer a consistent 30 days free trial of all features with the click of a button, plus, billings would be processed along with partner's Booking.com commission invoices.

Design principles:

- Stop with the multiple channels for starting a trial.
- No more bills spread all over the place on different dates.
- No more not knowing how long my trial is gonna last.
- No more billing without my acknowledgement.

The background image is a dark, blue-tinted photograph of a market stall. In the foreground, there are crates filled with various fruits, including red apples and yellow bananas. In the background, several posters are visible, one of which clearly says 'THE LAST CONCERT' with a date '17.11.17'. The overall atmosphere is dim and artistic.

Of course, proposing something is easy, delivering it at high quality not as much.

Some problems we encountered:

- Convincing product providers to offer our partners 30 days free trial
- Convincing product providers to make all of their features available to our partners during trial
- Ensuring a smooth transition from trial to paid, system wise
- Integrating the billing system of providers with the billing systems of Booking.com
- "Losing" money by stopping the automatic trial to paid.

Wizard of Oz is a design method in which participants interact with a system as if it was fully autonomous, however, it's actually operated by humans behind the scene.

Phase I: Concept release

- 10% of our partners in one specific region.
- 5 participating product providers.
- Manually processing billings together with booking invoices.

After 3 months

- High increase on trials started
- Decrease of customer support tickets about billing errors
- 100% of purchases were made with intend

Design Operations

My background

As a ThoughtWorks alumni, I've got the Agile blood running in my veins, and joining Booking didn't change the fact that I love seeing a good Agile and Design Thinking transformation happening everywhere I see a possibility.

Design Operations

Workshop freak

At Booking for ~6 years, I've ran all kinds of sessions with teams throughout the company, and when the Design leadership decided to create a Design Operations team, they knew they had to count me on that team.

Design Operations

Initiatives summary

I've been leading initiatives in collaboration with principals and managers for creating and managing design and writing operations within the organization with the goal of establishing more efficient practices that help our communities deliver high-quality, customer-centric, outputs.

Key initiatives I've been leading as Design Operations specialist

- **UX Hub:** The source of truth for all things UX
- **Feedback and quality culture:** creating space, trainings and a solid structure for people to have productive discussions about design quality (critiques, audits, reviews, demos).
- **UX Update:** Every quarter, I coordinate within the community to collect UX updates from all parts of the organization and then share it to a broader audience. This is especially appreciated by the Booking leadership.
